i You can stop or resume your submission at any stage, and you may go back to previous stages without losing entered information.

Process files

- i** This step runs all files through a series of automatic checks. Additionally, TeX and LaTeX source packages will be compiled into a PDF.
- i** Our system has automatically detected your files as type **PDF(La)TeX**.

If your submission is not of this type, or if you know which [TeXLive 2016](#) compiler will process your files best, choose that compiler. If you do not know which compiler will process best, leave this default alone.

Roy, Z. Rudy, O. Rundel, S. Sawant, et al. (26 additional authors not shown)

(Submitted on 13 Sep 2017 (v1), last revised 28 Nov 2017 (this version, v2))

Taking advantage of the high acceptance and axial symmetry of the WASA-at-COSY detector, and the high degree of the polarized proton beam of COSY, the reaction $pp \rightarrow pp\eta$ has been measured close to threshold to explore the analyzing power A_y . The angular distribution of A_y is determined with the precision improved by more than one order of magnitude with respect to previous results allowing a first accurate comparison with theoretical predictions. The determined analyzing power is consistent with zero for an excess energy of $Q = 15$ MeV signaling s wave production with no evidence for higher partial waves. At $Q = 72$ MeV the data reveals strong interference of P s and P p partial waves and cancellation of (P p) and Ss*Sd contributions. These results rule out the presently available theoretical predictions for the production mechanism of the η meson.
